CTO REPORT | WINDOWS EVENT LOGS

24h of activity under policy

What Windows Event Logs observed, what we intervened on, and where SentinelOne takes the insight next.

Window 2026-04-21 to 2026-04-22 UTC

`Data source  dataSource.name = 'Windows Event Logs'`

SentinelOne Pre-Sales Engineering

Generated 2026-04-22

Executive summary

396,405	Windows Event Log C...	24	#3
Total events (24h)	Dominant event.type	Timeline slices	Tenant rank (24h)

Three things for the CTO to act on

Dominant event.type: 'Windows Event Log Creation'.

396,405 events (100.0% of the window). Use this as the entry point when building detections or hunts against the source.

Tenant rank #3 in the last 24h.

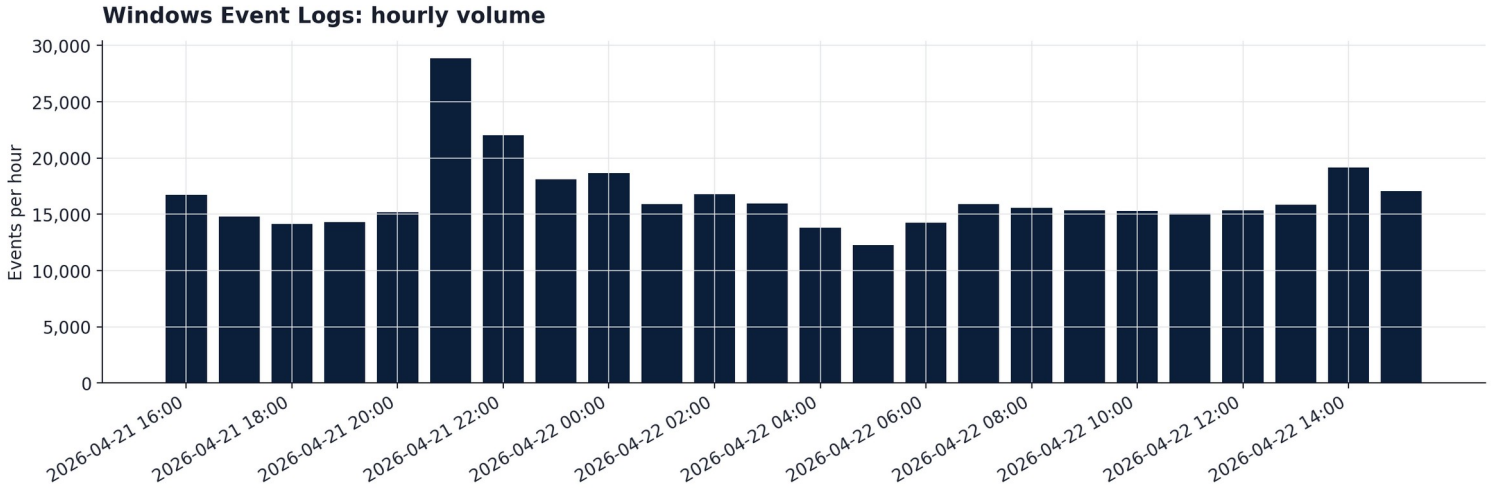
Windows Event Logs sits in the top tier of data sources landing in this tenant. A useful anchor for whether volume is trending or flat.

Same data lake as EDR + identity + network.

Any detection or hunt built on Windows Event Logs can join to SentinelOne endpoint context in one PowerQuery. No cross-system plumbing.

SECTION 2

Volume and timing

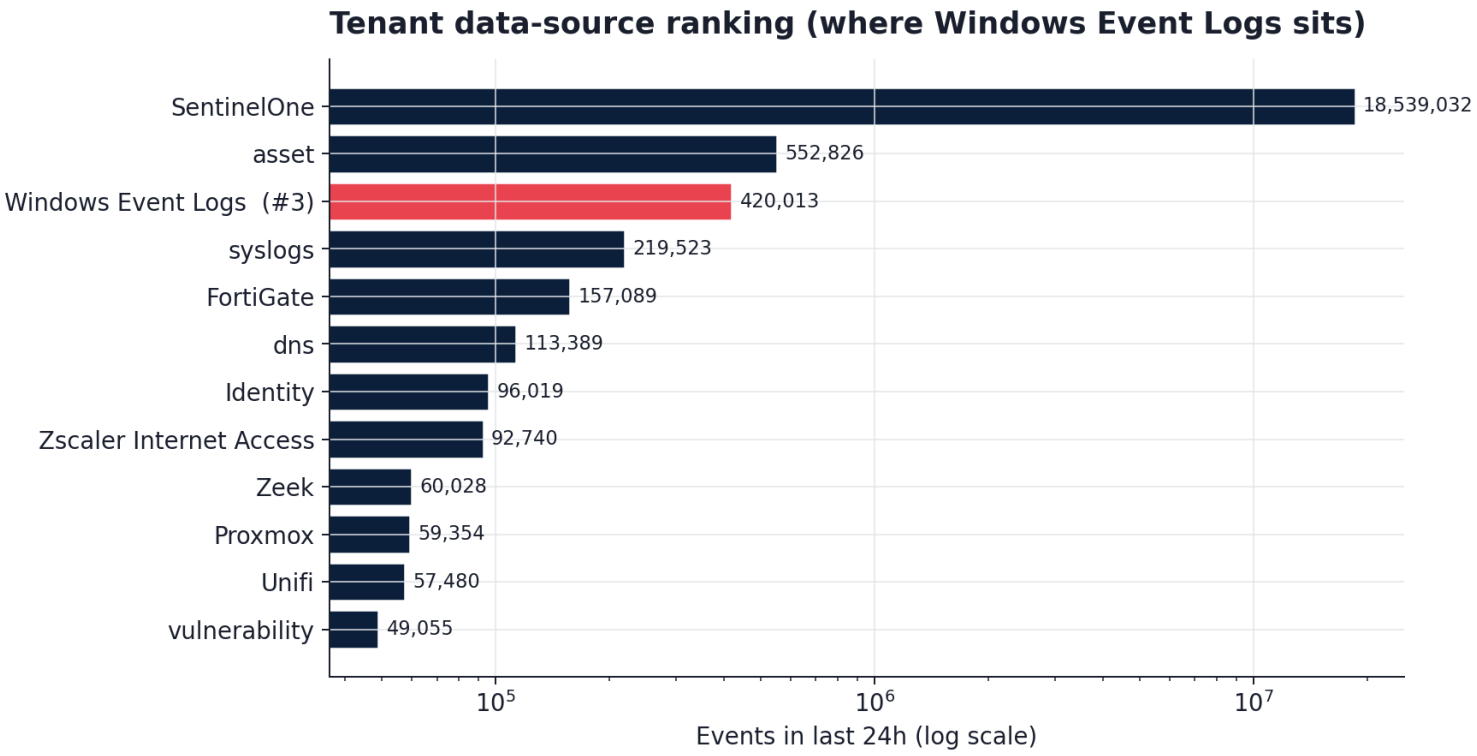


What to notice

- Evenly distributed across the window. Busiest slice (2026-04-21 21:00) only 7.3% ahead of average.
- Volume is the only lens available on Windows Event Logs today. Shape shifts in this timeline are the cleanest early warning for ingestion pipeline changes.

SECTION 7

Where Windows Event Logs sits in the broader tenant



What to notice

- In the last 24 hours, Windows Event Logs ranks #3 among the data sources landing in this tenant.
- Same data lake as SentinelOne EDR, identity, network, and cloud telemetry. Correlation is a PowerQuery join away.
- As usage grows, Windows Event Logs's share of daily events climbs in rank with zero ingestion changes.

Recommendations, prioritised

THIS MONTH

Enrich ingestion where it is shallow

Today, Windows Event Logs lands with a subset of fields populated. Add prompt / payload / content where possible; that unlocks content-based detections and Purple AI hunts across the same data lake.

QUARTERLY

Baseline normal

Re-run this report on a fixed cadence. Charts regenerate from a single JSON artefact, so 30- or 90-day views are a parameter flip. Anomalies feed the next round of tuning.

NEXT STEPS

Baseline Windows Event Logs, correlate with endpoint, and re-run this report.

Everything in this deck is reproducible from a single JSON artefact.
Re-run any time the workload shifts.

Thank you. Questions?
